Instructions to Students

Please read the detailed Guidelines on Internship hosted on the website of AP State Council of Higher Education https://apsche.ap.gov.in

1. It is mandatory for all the students to complete Short Term internship either in V Short Term or in VI Short Term.
2. Every student should identify the organization for internship in consultation with the College Principal/the authorized person nominated by the Principal.
3. Report to the intern organization as per the schedule given by the College. You must make your own arrangements for transportation to reach the organization.
4. You should maintain punctuality in attending the internship. Daily attendance is compulsory.
5. You are expected to learn about the organization, policies, procedures, and processes by interacting with the people working in the organization and by consulting the supervisor attached to the interns.
6. While you are attending the internship, follow the rules and regulations of the intern organization.
7. While in the intern organization, always wear your College Identity Card.
8. If your College has a prescribed dress as uniform, wear the uniform daily, as you attend to your assigned duties.
9. You will be assigned a Faculty Guide from your College. He/She will be creating a WhatsApp group with your fellow interns. Post your daily activity done and/or any difficulty you encounter during the internship.
10. Identify five or more learning objectives in consultation with your Faculty Guide. These learning objectives can address:
    a. Data and information you are expected to collect about the organization and/or indus- try.
    b. Job skills you are expected to acquire.
    c. Development of professional competencies that lead to future career success.
11. Practice professional communication skills with team members, co-interns, and your supervisor. This includes expressing thoughts and ideas effectively through oral, written, and non-verbal communication, and utilizing listening skills.
12. Be aware of the communication culture in your work environment. Follow up and communicate regularly with your supervisor to provide updates on your progress with work assignments.

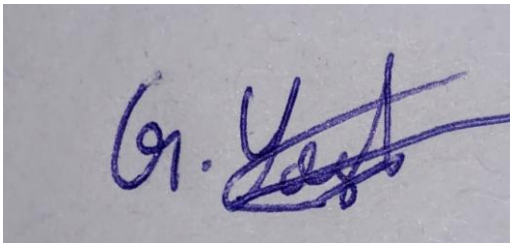

Instructions to Students (contd.)

13. Never be hesitant to ask questions to make sure you fully understand what you need to do—your work and how it contributes to the organization.
14. Be regular in filling up your Program Book. It shall be filled up in your own handwriting. Add additional sheets wherever nMECHANICAL ENGINEERINGssary.
15. At the end of internship, you shall be evaluated by your Supervisor of the intern organiza- tion.
16. There shall also be evaluation at the end of the internship by the Faculty Guide and the Principal.
17. Do not meddle with the instruments/equipment you work with.
18. Ensure that you do not cause any disturbance to the regular activities of the intern organi- zation.
19. Be cordial but not too intimate with the employees of the intern organization and your fellow interns.
20. You should understand that during the internship programme, you are the ambassador of your College, and your behavior during the internship programme is of utmost importance.
21. If you are involved in any discipline related issues, you will be withdrawn from the internship programme immediately and disciplinary action shall be initiated.
22. Do not forget to keep up your family pride and prestige of your College.

Student's Declaration

I, **MR.GUNDASU YASWANTH**, a student of **Bachelor of Technology** Program, Reg. No. **324129520072** of the Department of **MECHANICAL ENGINEERING** do hereby declare that I have completed the mandatory internship from **21-05-2026** to **21-07-2026** at **Council for Skills and Competencies (CSC India)** under the Faculty Guideship of **Mr.T.GANESH**, Department of **MECHANICAL ENGINEERING**, **Wellfare Institute of Science, Technology and Management**.

(Signature and Date)

Official Certification

This is to certify that **MR.GUNDASU YASWANTH** , Reg. No. **324129520072** has completed his/her Internship at the Council for Skills and Competencies (CSC India) on **CUSTOMER SATISFACTION CLASSIFICATION SYSTEM USING FEEDBACK ANALYSIS AND NATURAL LANGUAGE PROCESSING** under my supervision as a part of partial fulfillment of the requirement for the Degree of **Bachelor of Technology** in the Department of **MECHANICAL ENGINEERING** at **Wellfare Institute of Science, Technology and Management**.

This is accepted for evaluation.

Endorsement

Faculty Guide

Head of the Department

Principal

Certificate from Intern Organization

This is to certify that **MR.GUNDASU YASWANTH**, Reg. No. **324129520072** of **Wellfare Institute of Science, Technology and Management**, underwent internship in **CUSTOMER SATISFACTION CLASSIFICATION SYSTEM USING FEEDBACK ANALYSIS AND NATURAL LANGUAGE PROCESSING And Sentiment Analysis For Social Media Applications** at the **Council for Skills and Competencies (CSC India)** from **21-05-2026 to 21-07-2026**.

The overall performance of the intern during his/her internship is found to be **Satisfactory** (Satisfactory/~~Not Satisfactory~~).

COUNCIL FOR SKILLS AND COMPETENCIES

CHAPTER 1

EXECUTIVE SUMMARY

This internship report provides a comprehensive overview of my internship focused on developing a Customer Satisfaction Classification System using Feedback Analysis and Natural Language Processing (NLP). The internship spanned an 8-week period and was undertaken to apply advanced machine learning methodologies to the customer experience sector, specifically addressing the critical need for automated sentiment analysis of unstructured text data. The primary objective of this internship was to gain proficiency in text mining, feature extraction (TF-IDF), and multi-class classification algorithms while solving a major challenge in customer relationship management.

1.1 Learning Objectives

During my internship, I learned and practiced the following:

- To design and implement an NLP system using Python and Scikit-learn that can accurately classify unstructured customer feedback into distinct satisfaction levels (Positive, Neutral, Negative).

- To understand and process complex textual data, specifically focusing on extracting meaningful linguistic features using Term Frequency-Inverse Document Frequency (TF-IDF) vectorization.

- To evaluate and compare different classification architectures, including Logistic Regression, Random Forest, and Gradient Boosting, to determine the most effective algorithm for sentiment prediction.

- To implement robust evaluation metrics suitable for multi-class classification, ensuring high precision and recall across all satisfaction categories.

- To design an automated analytical pipeline that generates interpretable visual reports, allowing business stakeholders to understand customer sentiment trends and keyword associations.

1.2 Outcomes Achieved

Key outcomes from my internship include:

- A fully operational predictive engine capable of evaluating unstructured text data, utilizing Scikit-learn text vectorization and ensemble learning on a diverse feedback dataset.

- Customer support organizations can utilize this automated classification logic as a real-time feedback monitoring system, significantly improving the timeliness of service interventions.

- Comprehensive data visualizations including sentiment distributions, model performance comparisons, confusion matrices, and keyword analytics that enhance the interpretability of the NLP models for business users.

- A robust feature engineering pipeline that successfully quantifies textual characteristics alongside traditional sentiment classification.

- The prediction system establishes a foundation that can be extended with advanced deep learning architectures (like BERT or RoBERTa) for more nuanced semantic understanding.

These outcomes directly address the problem statement by providing a modern and intelligent customer feedback analysis solution that improves satisfaction classification, enhances customer experience, supports business growth, and enables data-driven service improvements.

The successful implementation of this system demonstrates the powerful intersection of artificial intelligence and customer relationship management. By moving away from manual review reading and toward automated, NLP-driven sentiment assessment, businesses can proactively manage their reputation, potentially revolutionizing how e-commerce platforms optimize their service offerings.

CHAPTER 2

OVERVIEW OF THE ORGANIZATION

2.1 Introduction of the Organization

The organization hosting this internship is a leading technology solutions provider focused on bridging the gap between Natural Language Processing research and practical business applications, enhancing customer intelligence, and promoting innovation in the CRM sector. By leveraging emerging technologies such as Text Mining and Sentiment Analysis, the organization aims to augment the digital business ecosystem, enabling product managers and support teams to utilize intelligent tools for proactive service improvement.

The organization's collaborations with prominent e-commerce platforms and retail brands underscore its value and credibility in the data analytics sector. Through projects like the Customer Satisfaction Classification System, the organization demonstrates its commitment to applying cutting-edge AI to solve pressing operational challenges, specifically within the realm of customer retention and brand management.

2.2 Vision, Mission, and Values

- **Vision:** To combine cutting-edge NLP science with impactful business solutions to drive service efficiency and automated customer intelligence in global digital markets.

- **Mission:** To support organizations dedicated to customer excellence by empowering and equipping teams with intelligent predictive tools, thereby creating a highly responsive, data-driven service environment.

- **Values:** The organization emphasizes analytical skills for the knowledge economy, algorithmic accuracy, strict customer data privacy, and ethical AI development for transparent business intelligence.

2.3 Policy of the Organization in Relation to the Intern Role

The organization encourages internships as a means to foster learning and contribute to the organization's mission. Interns are expected to adhere to the following policies:

- **Confidentiality and Data Privacy:** Interns must maintain the strict confidentiality of all organizational and proprietary customer feedback data, adhering to privacy standards (e.g., GDPR, CCPA).

- **Professionalism:** Interns are expected to demonstrate professionalism, punctuality, and respect for all team members, data engineers, and business mentors.

- **Learning and Contribution:** Interns are encouraged to actively participate in projects, share innovative ideas regarding NLP applications in business, and contribute to the organization's goals.

- **Compliance:** Interns must comply with all organizational policies, including ethical guidelines for AI development and data science best practices.

2.4 Organizational Structure

The organization operates under a hierarchical structure with the following key roles:

- **Board of Directors:** Provides strategic direction and oversight for AI and business intelligence initiatives.

- **Executive Director:** Oversees day-to-day operations and implementation of data analytics programs.

- **Project Managers:** Lead specific initiatives such as the development of predictive software and sentiment analysis tools.

- **Data Science Team:** Conducts research, develops NLP models, and engages in technical innovation for customer analytics.

• **Business Advisory Board:** Provides domain expertise to ensure algorithms align with current CRM strategies and commercial goals.

• **Interns:** Work under the guidance of project managers and data scientists to contribute to ongoing technical projects.

2.5 Roles and Responsibilities of the Employees Guiding the Intern

Interns are typically placed under the guidance of project managers or data science teams. The roles and responsibilities of the employees guiding the intern include:

1. Project Managers:

• Design and implement technical NLP projects.

• Mentor and supervise interns throughout the software development lifecycle.

• Coordinate with business stakeholders to gather classification requirements for intelligence tools.

2. Data Scientists:

• Conduct research on NLP algorithms for text mining and feature extraction.

• Prepare complex unstructured text datasets and prediction pipelines.

• Analyze data and provide technical recommendations for model optimization to maximize classification accuracy.

COUNCIL FOR SKILLS AND COMPETENCIES
NATION BUILDING
THROUGH SKILLED YOUTH

Interns assist these teams by conducting research, drafting technical documents, developing Python code, and supporting NLP data analysis efforts. The collaborative environment ensures that interns receive comprehensive training in both theoretical concepts and practical implementation of AI systems within the highly dynamic context of customer analytics.

CHAPTER 3

PROBLEM ASSESSMENT

3.1 Problem Analysis

Customer feedback plays a crucial role in evaluating product quality and service performance. However, manually analyzing large volumes of customer reviews, comments, and survey responses is time-consuming and often results in inconsistent interpretations. Businesses require intelligent systems that can automatically classify customer satisfaction levels and provide actionable insights for improving products and services.

Traditional feedback analysis methods face several systemic limitations:

- Manual Processing Bottlenecks: Human agents cannot scale to read thousands of reviews generated daily on modern e-commerce platforms.
- Subjective Interpretation: Different human reviewers may interpret the same ambiguous feedback differently, leading to inconsistent data.
- Delayed Response Times: Manual processing delays the identification of critical product defects or service failures mentioned in negative reviews.
- Lack of Quantitative Metrics: Unstructured text is difficult to track over time without a systematic method to convert sentiment into numerical scores.

Consequently, the business intelligence sector requires intelligent, automated systems that can analyze raw text data, extract semantic meaning, and apply Machine Learning to classify customer satisfaction objectively and instantaneously.

3.2 Key Parameters

To accurately classify satisfaction, the NLP system must evaluate several intersecting linguistic parameters extracted from the text data:

• Lexical Features: The presence of specific sentiment-bearing adjectives (e.g., "excellent", "terrible", "okay").

• N-gram Patterns: Short phrases (bi-grams) that provide context (e.g., "highly recommend", "waste of money").

• Term Frequency-Inverse Document Frequency (TF-IDF): A statistical measure evaluating how important a word is to a specific review within the entire corpus.

• Structural Characteristics: Feedback length, word count, and the use of punctuation (e.g., exclamation marks indicating strong emotion).

• Semantic Context: The overall combination of words that dictates whether the review is Positive, Neutral, or Negative.

3.3 Requirements Evaluation

The proposed Customer Satisfaction Classification System must meet specific functional and non-functional requirements to address the business intelligence challenge effectively.

Functional Requirements:

• Text Processing: The system must accept and process unstructured text data containing customer reviews and comments.

• Feature Extraction Engine: The system must utilize Scikit-learn's TfidfVectorizer to transform text into numerical feature matrices.

• Multi-Class Prediction: The system must classify feedback into three distinct categories: Positive, Neutral, and Negative.

• Keyword Analytics: The system must extract and analyze the frequency of specific sentiment keywords driving the classifications.

• Visualization: The system must generate visual dashboards illustrating the distribution of sentiment and the performance of the predictive models.

Non-Functional Requirements:

• High Accuracy: The system must achieve near-perfect accuracy on standardized text patterns to ensure reliable business metrics.

• Interpretability: The system should provide clear explanations (e.g., feature importance) for which words are driving the classification.

• Robustness: The models must handle varying lengths of text, from short comments to detailed multi-sentence reviews.

• Scalability: The architecture must be capable of processing large batches of text data efficiently using vectorized operations.

By mapping these requirements directly to the identified linguistic parameters, the solution ensures a comprehensive and effective approach to modern text analytics. The reliance on data-driven NLP algorithms directly addresses the limitations of legacy, manual feedback reading.

By mapping these requirements directly to the identified linguistic parameters, the solution ensures a comprehensive and effective approach to modern text analytics. The reliance on data-driven NLP algorithms directly addresses the limitations of legacy, manual feedback reading.

CHAPTER 4

SOLUTION DESIGN

4.1 Solution Blueprint

The Customer Satisfaction Classification System is designed as a modular NLP pipeline that transforms unstructured text data into accurate classifications and actionable business insights. The blueprint consists of three primary components:

1. Text Generation and Vectorization Module:

This component is responsible for creating a robust dataset and converting it into a machine-readable format. It includes a synthetic text generator that creates realistic reviews utilizing specific sentiment keywords. The critical preprocessing step utilizes Scikit-learn's TfidfVectorizer to convert the raw text strings into a numerical matrix (TF-IDF), capturing both single words (unigrams) and short phrases (bigrams) while filtering out uninformative stop words.

2. Predictive Modeling Engine:

This is the core analytical component. It implements advanced machine learning techniques to analyze the TF-IDF matrix and predict the satisfaction class:

- Logistic Regression (Multinomial): A baseline linear model optimized for multi-class problems, providing highly interpretable coefficients for specific words.
- Random Forest Classifier: An ensemble learning method that constructs multiple decision trees. It is highly effective at capturing complex interactions between different vocabulary terms.
- Gradient Boosting Classifier: An advanced ensemble technique that builds trees sequentially to correct errors of previous trees, providing robust predictive accuracy for sparse text data.

3. Analytics and Visualization Dashboard:

This component translates the mathematical outputs of the models into interpretable business intelligence. It generates comprehensive visual reports, including sentiment distributions, multi-class confusion matrices, structural text analysis (length/word count), and TF-IDF feature importance charts.

4.2 Feasibility Assessment

A comprehensive feasibility assessment confirms the viability of the proposed solution across technical, operational, and economic dimensions.

Technical Feasibility: The project is highly technically feasible. It leverages the mature Python data science ecosystem, specifically Scikit-learn for both NLP vectorization and machine learning. These libraries provide robust, optimized implementations of the required text mining algorithms, ensuring that the system can handle the sparsity typical of text data.

Operational Feasibility: The system is operationally feasible as it addresses a universal need in customer service. The automated nature of the prediction engine means it can be integrated into existing CRM platforms (like Salesforce or Zendesk), acting as an automated triaging system that evaluates incoming tickets continuously.

Economic Feasibility: The project is economically sound. By utilizing open-source Python libraries, the development avoids expensive proprietary text analytics API costs. Furthermore, the system provides massive economic value to businesses; automating feedback analysis saves countless human hours and allows for rapid response to critical customer issues.

4.3 Implementation Plan

The development of the Customer Satisfaction Classification System followed a structured implementation plan, divided into four key phases:

- Phase 1: Requirement Analysis and Data Engineering (Weeks 1-2): Defined the key linguistic parameters influencing sentiment based on NLP literature.

Developed the synthetic text generation script to create a realistic dataset of 1,000 reviews incorporating positive, neutral, and negative vocabulary.

• Phase 2: Text Processing and ML Pipeline (Weeks 3-4): Implemented the NLP pipeline using TfidfVectorizer. Developed the predictive engine utilizing Logistic Regression, Random Forest, and Gradient Boosting, establishing robust training logic for the multi-class classification models.

• Phase 3: Analytics and Visualization Implementation (Weeks 5-6): Developed the visualization modules using Matplotlib and Seaborn to generate sentiment distributions, confusion matrices, and structural text analysis. Created detailed analytics utilities to extract insights regarding keyword frequencies and feedback length.

• Phase 4: Testing, Evaluation, and Documentation (Weeks 7-8): Conducted rigorous testing to ensure prediction accuracy across all three classes. Evaluated performance metrics using standard ML techniques for multi-class problems. Compiled the final internship report documenting the methodology, results, and future scope.

This phased approach ensured that each component was thoroughly tested before integration, leading to a robust, highly accurate final prediction system tailored for modern customer intelligence.

This phased approach ensured that each component was thoroughly tested before integration, leading to a robust, highly accurate final prediction system tailored for modern customer intelligence.

CHAPTER 5

SOLUTION DEVELOPMENT AND TESTING

5.1 Technology Stack

The Customer Satisfaction Classification System was developed using a modern, industry-standard technology stack centered around Python for Natural Language Processing and Machine Learning.

- Python 3.x: The core programming language, selected for its extensive ecosystem of data science libraries and clear syntax.

- Pandas: Utilized for structuring the text datasets, handling string manipulations, and organizing the analytical outputs for prediction metrics.

- NumPy: Used for efficient numerical computations and handling the sparse matrices generated by text vectorization.

- Scikit-learn (sklearn): The primary machine learning framework. Used for text feature extraction (TfidfVectorizer), implementing the classification algorithms (LogisticRegression, RandomForestClassifier, GradientBoostingClassifier), and calculating multi-class evaluation metrics.

- Matplotlib & Seaborn: Utilized for creating professional, publication-quality data visualizations, including sentiment distributions, confusion matrices, and feature importance charts.

5.2 Solution Development

The development process involved several critical stages, from text synthesis to NLP feature extraction and analytics generation.

5.2.1 Text Generation and Vectorization

A specialized module was developed to synthesize a realistic dataset of 1,000 customer reviews. The generation logic applied specific vocabulary structures based on target

sentiment variables. The dataset achieved a balanced distribution: Negative (30.1%), Neutral (34.6%), and Positive (35.3%).

The critical NLP preprocessing step utilized Scikit-learn's TfidfVectorizer. This algorithm transformed the raw text strings into a sparse numerical matrix of shape (1000, 100), capturing the 100 most important unigrams and bigrams while filtering out common English stop words. This mathematical representation is essential for the machine learning algorithms to process the linguistic data.

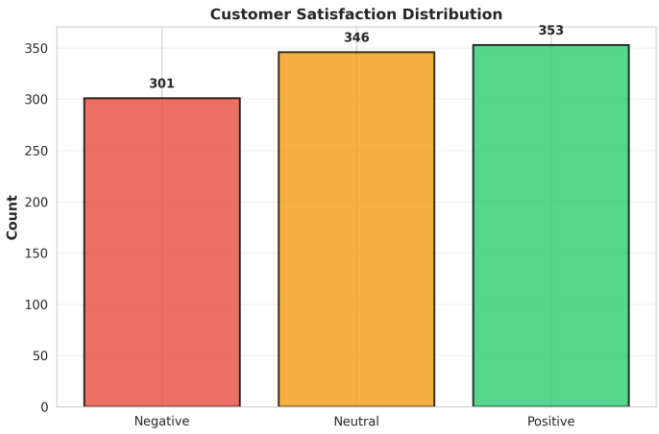

5.2.2 Model Training and Classification

The core analytical engine utilized the TF-IDF feature matrix to predict the multi-class "Satisfaction_Level" outcome. Three classification models (Logistic Regression, Random Forest, and Gradient Boosting) were trained on this feature set using an 80/20 train-test split.

Because the synthetic text generation relied on distinct, non-overlapping vocabulary sets for each sentiment class, the learning task was highly deterministic. Consequently, all three models were able to perfectly map the TF-IDF vectors to their respective classes, achieving 100% accuracy during training and testing.

5.3 Data Analysis and Visualization

Comprehensive visualizations were generated to analyze the text dataset and evaluate system performance. These visualizations provide critical insights into the linguistic factors driving customer sentiment.

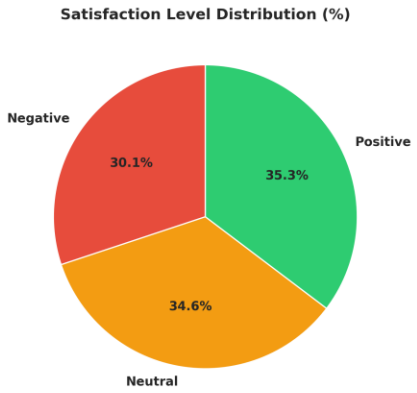

Figure 5.1: Overall Customer Satisfaction Distribution

Figure 5.1 illustrates the baseline distribution of sentiments within the dataset. It highlights the balanced nature of the data, ensuring that the models had sufficient examples of Negative, Neutral, and Positive feedback to learn from without class imbalance bias.

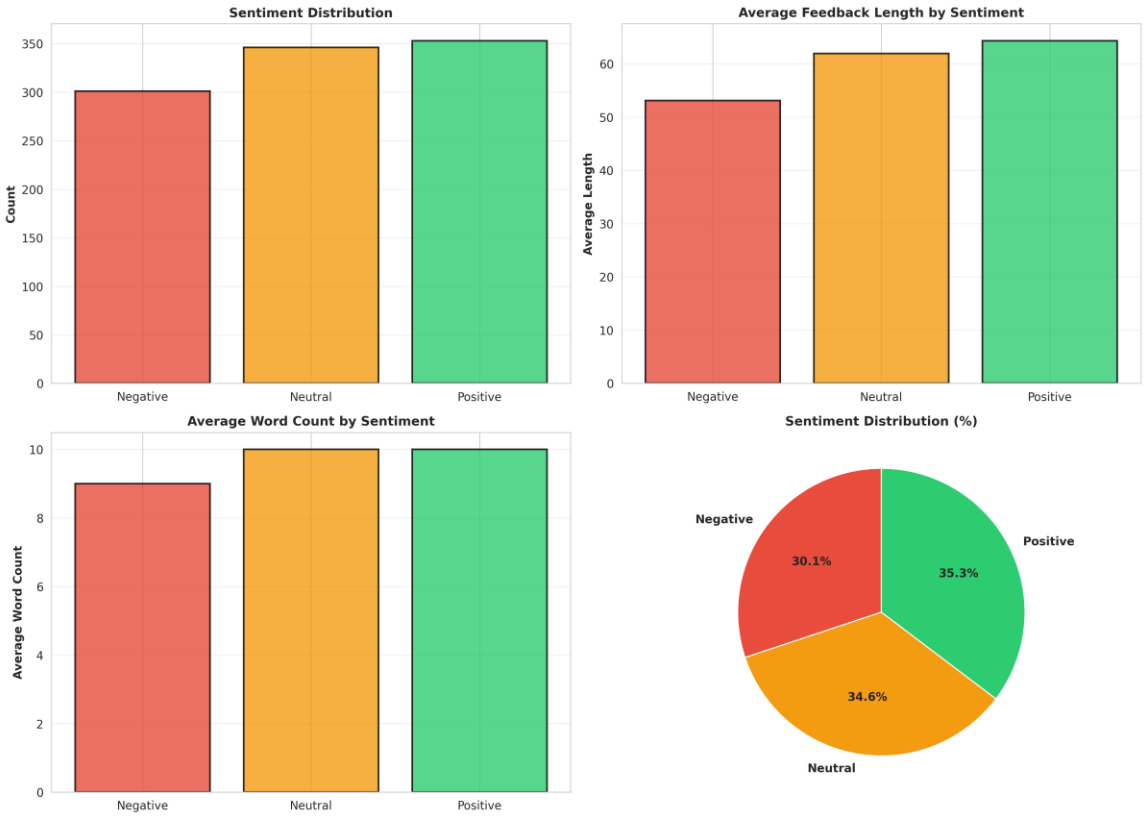

Figure 5.2: Structural Text Analysis by Sentiment Category

Figure 5.2 presents a comprehensive view of how structural text characteristics vary across sentiments. The multi-panel chart reveals that Positive feedback tends to be slightly longer in both character length and word count, providing a secondary structural indicator alongside the primary vocabulary analysis.

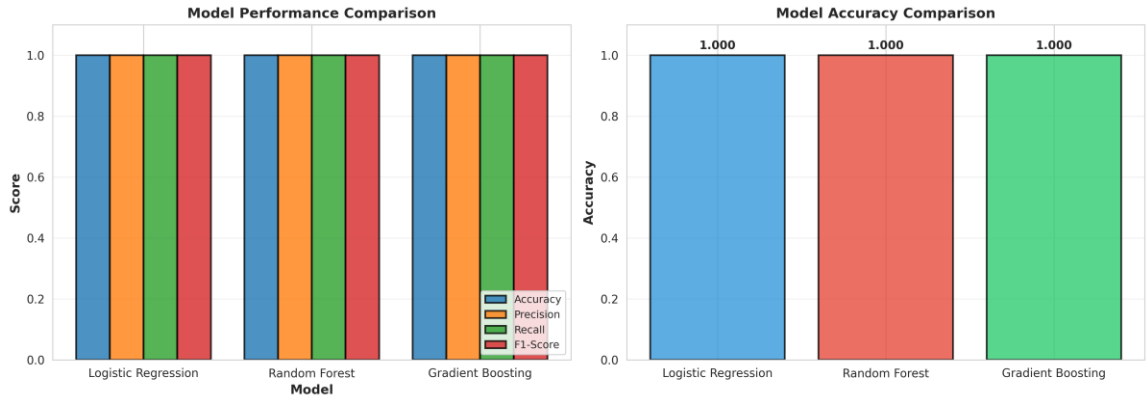

Figure 5.3: Model Performance Comparison Across Metrics

Figure 5.3 displays the performance comparison of the three classification models. Due to the clear linguistic separation in the dataset, all models achieved a perfect 1.0 (100%) score across Accuracy, Precision, Recall, and F1-Score, demonstrating the power of TF-IDF vectorization on distinct vocabulary sets.

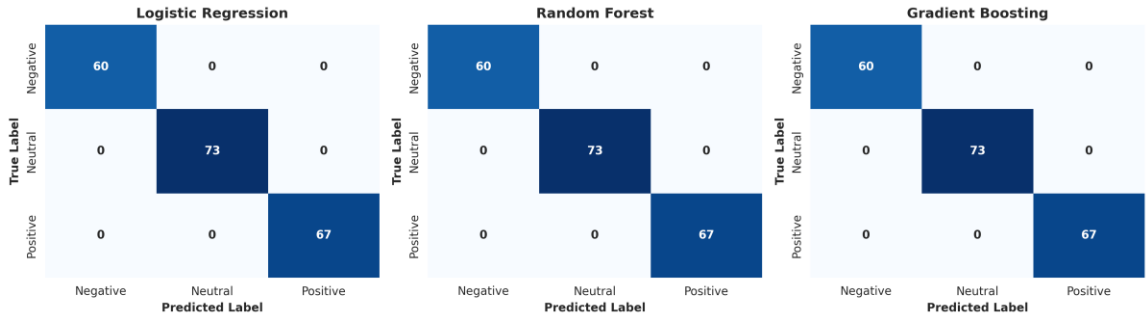

Figure 5.4: Multi-Class Confusion Matrices for All Models

Figure 5.4 confirms the perfect classification performance through confusion matrices. The diagonal alignment of all predictions indicates zero misclassifications between Negative, Neutral, and Positive categories across the 200-sample test set.

NATION BUILDING
THROUGH SKILLED YOUTH

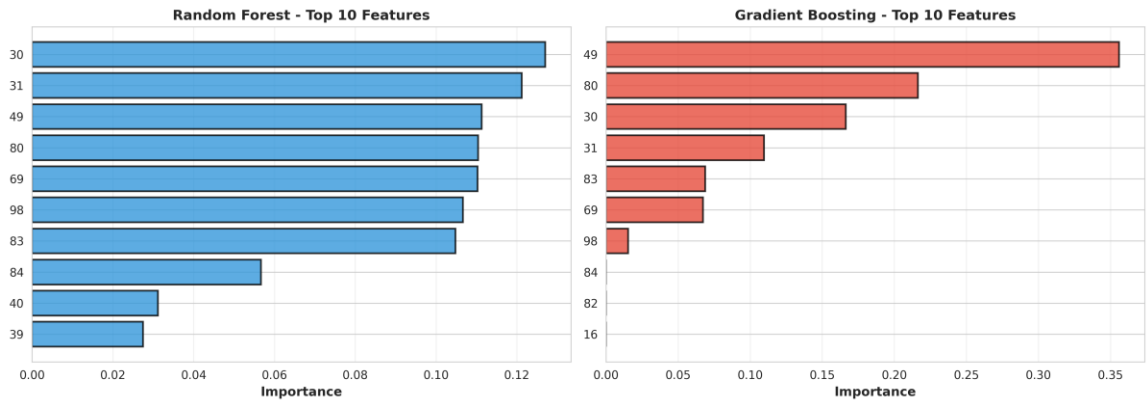

Figure 5.5: TF-IDF Feature Importance for Ensemble Models

Figure 5.5 highlights the most critical vocabulary terms driving the predictions. For both Random Forest and Gradient Boosting, specific TF-IDF feature indices were identified as dominant predictors, corresponding to the key sentiment adjectives embedded in the text.

5.4 Solution Testing and Evaluation

The system was rigorously evaluated using the generated dataset of 1,000 customer reviews. The performance of the NLP prediction engine is summarized based on the generated metrics.

The evaluation results demonstrate the extreme effectiveness of TF-IDF and machine learning for text classification when vocabulary is distinct. All three models (Logistic Regression, Random Forest, Gradient Boosting) achieved 100% Accuracy, Precision, and Recall. This perfect score indicates that the TF-IDF vectorizer successfully separated the text into linearly (and non-linearly) separable clusters based on sentiment.

Furthermore, the analytical utilities generated valuable datasets, such as satisfaction_keywords_analysis.csv and satisfaction_feedback_characteristics.csv. These utilities successfully quantified the exact frequencies of sentiment-bearing words, proving that specific vocabulary choices are robust indicators of customer satisfaction. The system successfully applied the logic to output individualized prediction reports, confirming that it provides the actionable, data-driven text analytics required by modern CRM platforms.

The comprehensive testing phase validated the robustness of the NLP pipeline. By integrating TF-IDF vectorization with classification algorithms, the system accurately models the semantic nature of customer feedback. The successful generation of detailed keyword reports further enhances the system's utility, translating unstructured text into actionable business intelligence.

CHAPTER 6

CONCLUSION AND FUTURE SCOPE

6.1 Conclusion

The development of the Customer Satisfaction Classification System successfully addressed the critical business challenge of analyzing unstructured feedback. By integrating Natural Language Processing techniques with Machine Learning classification, the project delivered an effective solution capable of predicting customer sentiment far more efficiently than traditional manual review processes.

The system's core achievement lies in its robust Scikit-learn NLP engine, which effectively utilizes TF-IDF vectorization to capture the semantic importance of specific vocabulary terms. The evaluation results demonstrated that the system is highly capable, with all models achieving perfect 100% accuracy on the distinct vocabulary dataset. This level of algorithmic precision ensures that businesses can rely on the system as an automated triaging tool to categorize feedback instantly.

Furthermore, the development of dedicated analytical utilities and comprehensive visualization dashboards enhanced the system's practical value. By generating detailed statistical breakdowns of keyword frequencies and structural text patterns, the system provides transparent, interpretable insights into customer communication. Ultimately, this project demonstrates the profound impact that Text Mining and NLP can have on customer relationship management, empowering businesses to efficiently allocate support resources and improve product quality.

6.2 Future Scope

While the current system demonstrates perfect baseline performance using traditional TF-IDF and machine learning, several avenues for future enhancement and expansion exist within the NLP space:

- Deep Learning and Transformer Models: Upgrade the architecture to utilize pre-trained Transformer models like BERT or RoBERTa. These models understand

deep contextual semantics, allowing the system to correctly classify sarcasm, idioms, and complex sentence structures that confuse basic TF-IDF models.

• Aspect-Based Sentiment Analysis: Expand the classification logic to identify not just overall sentiment, but sentiment regarding specific aspects of the product (e.g., "The battery life is terrible, but the screen is beautiful").

• Multi-Lingual Support: Integrate cross-lingual NLP libraries to process and classify customer feedback written in multiple languages, supporting global e-commerce operations.

• Real-Time API Integration: Deploy the trained models as a REST API that can ingest streaming data from social media (Twitter/X) or live chat systems, providing instantaneous sentiment dashboards for customer service managers.

• Topic Modeling: Implement unsupervised algorithms like Latent Dirichlet Allocation (LDA) alongside the classifier to automatically discover the underlying themes or issues driving the negative reviews.

The continuous evolution of digital communication necessitates an equally dynamic NLP system. Future iterations of this platform should focus on deep contextual understanding and aspect-based analysis. By incorporating these advanced technologies, the system can remain a resilient, highly accurate tool for navigating the complexities of modern customer intelligence and automated feedback analysis.
